ABINASH DEVENDHIRAN

Full Stack Developer

CONTACT

Chennai, India

EDUCATION

B.Sc Computer Science

J.H.A Agarsan College, Madras University

2017 - 2020

Chennai, TN

SKILLS

- Ruby on Rails
- Python
- React / Vue / Nuxt
- PostgreSQL
- Web Scraping & Data Pipelines
- Database Design
- Team Leadership & Code Review

LANGUAGES

- Tamil — Native
- English — Professional

WORK EXPERIENCE

Solution Consultant - Francium Tech

May 2021 - Present

Teldat VPN · Technical Lead

Oct 2026 - Present

Multi-tenant VPN platform where tenant admins manage users, access, antivirus and log collection from a central portal, and client apps enforce those rules on each machine.

- ***Product scope:*** led delivery across four codebases of the beSafe family: the admin portal, the Android and desktop VPN client, the Windows client with its background services, and an inline malware-prevention proxy.
- ***Admin portal:*** Rails API, React SPA and a Go log enricher on ClickHouse, where security profiles are turned into device configuration and device logs flow back for reporting, with role-based access for six roles.
- ***VPN clients:*** Tauri v2 and React with a Rust OpenVPN core on Android, and a .NET MAUI app with three Windows services for VPN, monitoring and NetFlow export.
- ***Malware prevention:*** a Rust TLS/QUIC-intercepting proxy that scans downloads with ML classifiers and blocks malicious files, controlled from the VPN client so both run together inside one VPN service on Android.
- ***Requirements:*** worked directly with the client and broke the requirements down into clear, assignable tasks across the stacks.
- ***Team management:*** led 5 developers, assigning work, running daily stand-ups and tracking progress through to delivery.
- ***Code review:*** reviewed pull requests across Rails, React, Rust and C# with AI assistance, studying every feature and bug fix in detail before commenting.

Stack: Ruby on Rails, React, Go, ClickHouse, Rust, Tauri, C# (.NET MAUI), OpenVPN

Golden Set Analytics · Data Engineer

Jan 2026 - Sep 2026

Tennis analytics platform built on open match and player data, offering rankings, stats and video analysis, and helping clients scout rising players.

- ***Scrapers:*** built and maintained scrapers for CoreTennis, ITA, WTN, ITF and ATP/WTA, on weekly Celery Beat schedules with shared run and stats helpers, replacing one-off manual scripts.
- ***Two-layer pipeline:*** raw rows land idempotently in an intake schema keyed by source and source id, then get promoted into one canonical, source-neutral dataset that backs the platform's rankings, stats and analysis.
- ***Player matching:*** matched the same player across sources using name similarity with birth year and nationality, with auto-merge, review and new-player routing, and a guard so one source never maps two ids to one player.
- ***Data normalisation:*** normalised country codes to ISO across sources, and fixed ATP date-of-birth enrichment that had never succeeded, including retired players and Cloudflare-blocked pages.
- ***Backfills and repairs:*** wrote backfill commands for missing country and birth year and ITA/WTN id repair, plus a state-machine repair command and a read-only report to verify intake-to-canonical links.
- ***Duplicate matches:*** investigated a bug where one match was attributed to several tournaments (about 11.8k excess rows across 332 tournaments on QA), traced it to the scraper, fixed it and wrote a backfill for rows already written.

Stack: Python, Django, PostgreSQL, Celery, Redis, Docker

WORK EXPERIENCE

Atrium · Technical Lead

Jul 2025 - Dec 2025

Parental-control and screen-time app that tracks and limits app and website usage on a child's device, while parents manage rules, reports and extra-time requests from their own phone.

- ***Project setup:*** initialised the project and set up the Rails 8 API, Flutter app and React web app from scratch.
- ***Data model:*** designed the database structure for families, members, devices, installed apps, daily usage, limit rules, app categories and extra-time requests.
- ***Technical decisions and app flows:*** made the core technical decisions and defined the parent and child flows, including a Flutter platform-dispatch pattern that keeps each OS behind one service, and role-based authorisation.
- ***Android:*** tracked per-app usage with periodic sync to the backend, and enforced daily limits, app blocks and website blocking through Usage Stats and an Accessibility Service.
- ***iOS:*** used Apple's Family Controls and Screen Time APIs (Managed Settings and Device Activity) to find and control app usage, working around iOS hiding the installed-apps list by selecting apps through the system picker and storing their opaque tokens.

Stack: Ruby on Rails, PostgreSQL, Flutter, React, Kotlin, Swift, Firebase

Pan Agro · Lead Developer

Feb 2024 - Jun 2025

Spain-based agri marketplace where farmers list produce, retailers place requests, and transporters bid tender-style for delivery.

- ***Marketplace flows:*** production offers, buyer requests, negotiations, orders and shipments for producers, buyers, suppliers and transporters, with in-app chat and notifications pushed over WebSocket and email.
- ***Transport tendering:*** transporters bid on deliveries, and an accepted offer creates a blockchain smart contract and generates the transport contract PDF from the PIDA template.
- ***Market data and forecasting:*** loaded market price curves from LSEG and the MAPA open data into Apache Druid, and served ARIMA price predictions through a FastAPI model selector.
- ***Weather and crops:*** weather data and crop growth stages per region, feeding the farmers' dashboards.
- ***Virtual data room:*** role-checked multi-file upload of certificates and insurance documents to MinIO.
- ***Secure engine:*** shipped the core logic (authentication and role permissions, insurance premiums, price forecasting, blockchain contract calls, chat) as a compiled Go executable, so the client receives no source and our IP and copyright stay protected. The API runs it as a child process over a JSON stdin/stdout protocol, with health checks and automatic restart.
- ***Team:*** reviewed pull requests and regularly handled people management for the team.

Stack: Go, Ruby on Rails, React, React Native, PostgreSQL, Apache Druid, FastAPI, MinIO, Docker

Earlier Projects

- **Hero7** (2023-24): Migrated a C#/Angular audit app to Ruby on Rails + Vue (Pinia), including the DB redesign.
- **MoneySmart** (2023): Personalised recommendations with A/B testing (ABTasty, GrowthBook) and a claims flow with SendGrid emails.
- **Teldat BeActive** (2022): PDF data extraction, real-time updates via WebSockets, and analytics queries for dashboards.
- **Recruit & Soul Search** (2021): Token auth, interview scheduling jobs, and reusable Vue components.

★ FREELANCE PROJECTS

Magizh Foods · Full Stack Developer

Feb 2026 - Present

Platform for a cloud kitchen with home delivery. Customers order one-time or subscribe to variety of plans, and the kitchen runs everything from an admin portal.

- Built the whole platform ***solo*** and deployed it on Railway.
- ***Four roles, each with its own flow:*** admin and customer on both web and mobile, kitchen worker and delivery partner on mobile only. Access is enforced on the backend with role-based permissions.
- ***Flexible orders:*** one-time or subscription, a different delivery address per meal, and the dates and shifts to include or exclude chosen while subscribing.
- ***Admin-configurable pricing:*** per-plan discounts for longer plans, delivery fee by road distance via Google Maps, and a coupon and referral system.
- ***Meal skipping*** before the deadline, with the skipped meal added to the end of the subscription or refunded to the wallet.
- ***WhatsApp-first:*** OTP login, order notifications, and a reminder 2 hours before the skip deadline so customers can skip the meal inside WhatsApp itself.

Stack: Rails 8, PostgreSQL, React, TypeScript, Flutter, Razorpay, WhatsApp API, FCM, Google Maps, Railway

Fampic Registry · Full Stack Developer

Oct 2026 - Present

Serverless work and payment registry for a photo studio. Every phone and computer holds a full copy of the data and syncs directly with the others.

- ***Device discovery:*** devices find each other through a group-secret-derived beacon on the n0 pkarr relay and connect over iroh, using hole punching with the n0 relay as fallback.
- ***Data sync:*** devices exchange version vectors and sync only the missing `(deviceId, seq)` events, with live push and peer-to-peer relaying.
- ***Conflict resolution:*** Lamport clocks with a deviceId tie-break and tombstones for deletes, so every device converges to the same state without using wall-clock time.
- ***Offline-first storage:*** a local event log and version vector on each device, with entries rebuilt from the log and an export/import of the full data as the backup.
- ***Security:*** event payloads encrypted with a shared group data key, per-login Ed25519 signatures on every event, and Argon2-derived password keys, with no password hash stored.

Stack: Flutter, C#, Swift, Rust, iroh
